One of the main features of the HD Space Audio Player is its ability to include a specific sound clip in the selected audio file and play it when the corresponding button is pressed. The included sound clips are high-quality audio recordings with a high definition quality, and this section of the application lets you choose which to use to your liking. Choose the sound clip you want to add to your audio file If you're using an audio file on

your computer, this feature comes in handy for all kinds of uses. You can either set the sound clip to be a direct part of the audio file or drop it into a separate audio file you already have. You can even use more than one clip in the same audio file by selecting multiple sounds. Add more sound clips to your audio file After the selection is made, the application allows you to do a few additional things to prepare the files for the audio player. It might be possible to adjust the pitch, volume, length, and time of the clip, which will take a

little of your time for a minor adjustment. A few last words Even though the included sound clips are very high quality, you can replace them with another clip of the same genre. The options available are “built-in” or “SoundCloud.” HD Space
