Drums can be made with a single sweep, multiple sweeps (chord-riffs), a custom wave, pink or white noise, a custom wave or even complex waveforms. An incredible collection of factory and user presets are included with the application! As DrumSynth is an interactive instrument, you can combine the sounds into patterns and patterns into sequences. In the 'Design' view, you can re-arrange the slices of sound that make up a drum in any order. For example, you can start with a hi-hat, move it up a little and add a kick drum to the end. To create new sounds or edit existing sounds, select a slice in the 'Chords' view and hit " on your keyboard. There are 3 main ways to control the sound that results: Drag and drop the selected slice onto the left-hand side of the screen Click and hold on a slice to add it to the new wave (this is useful if you need to make some changes to a sound) Hit the [End] button and hit 'Enter' on your keyboard to save your changes To add a new drum, just click on the 'Drums' button in the 'Design' view and use the new 'Create new drum' dialog. The dialog will guide you through the options

needed to create the drum. You can also enter a sound from the list of available user-created presets. You can synchronize the frequency of the drum with the frequency of another parameter, or play two drums at different frequencies simultaneously. The

Synth and Delay modes are great for creating complex waveforms. For complex waveforms, the more slices you add, the greater the sound becomes. To view the sound that's currently playing, hit the 'Show/Hide' button and the 'Full Screen' button in the 'Design' view. Check out the 'Reverb' view for great high-pass and low-pass reverbs!

The 'Reverb' view offers a wide range of reverb effects and you can easily set a different value for each parameter on the reverb. You can also load one of your own reverb presets or create a custom reverb. You can also apply a compression effect to the sound, which can either boost or cut the peak of the sound. Use the mixer to add more effects, pan

### What's New In?

DrumSynth is a revolutionary software synth. It lets you build sounds out of swept frequency sine waves, noise bands, pink and white noise and complex waveforms. You can make sounds as old as the classic analogue drum machines, but you can also make entirely new sounds, pitched sounds and sound effects. Our inspiration was Max MSP and MAX/MSP, one of the first true software instruments, but we wanted to make our software synth not only sound great, but also get out of the way and keep you focused on the music. You just press play and DrumSynth starts building the sounds right on the screen. It's intuitive and you can control everything from where the sound starts, ends, stops, scales, and modifies the original shape of the sound - just by playing it.
